

Tejco Vision Brings you Hair Trans, your One Stop Shop & the Speciality division of Tejco Vision for hair Restoration devices, Instrumentation & Training.

Hair Trans Speed

The **Tejco Hair Trans Speed** is an advanced microprocessor controlled programmable device with digitized options for Speed, Torque and Counter Mechanism.

In skilled hands, the Hair Trans Speed is said to

- Be minimally invasive
- Virtually pain free
- Reduce the time of FU extraction sessions
- Reduce potential for scarring
- Have minimum transection

WHY HAIR TRANS SPEED scores over Regular FUE extractors

	REGULAR FUE	HAIR TRANS SPEED
PROGRAMMABLE	Zero controls. Only has a speed knob, where one is not even aware of the speed they are working on	Is a programmable microprocessor controlled device. Depending on the different scalp conditions and area of extraction various settings with various parameters value can be saved as preset programs for easy use. 9 Programs can be saved to suit different scalp types, body hair transplant, chest, beard etc.
SPEED	Disadvantage of a “blind” speed. Quick transection of roots, with slightest mismatch in angle. Roots get cut through, before we can realize and control the instrument Punch slips deeper, hits the blood vessel and causes bleeding Creates heat which can damage the graft, leading to poor growth.	All disadvantages of blind speed are eliminated The rotation per minute depends on the user preference, a starter should start with a speed of 800 rpm and can increase more than 1200 rpm once hand coordination and depth control is achieved. In case too much pressure is applied while entering the scalp, the chances of transection is high so it would be ideal to keep it at lower speeds. An experienced surgeon can control the pressure exerted and can perform at higher speeds resulting in faster extraction of grafts.
TORQUE	No torque controls - Hence difference in resistance required for soft and hard scalp cannot be taken care of	Difference in the softness & hardness of the scalp skin requires different grades of resistance, this can be managed with torque levels Hard scalp requires more power, hence higher torque & vice versa.
MODES	Foot pedal controlled, takes long hours. Has no multiple mode options.	Has 2 modes, Continuous & Auto Reverse, Auto Rev means as you enter in to the scalp if resistance occurs the punch changes direction and rotate in the opposite direction to prevent the punch from stopping and getting stuck, minimizing transection to a high degree Auto reverse allows you to work without foot pedal, hence saves time and helps to continue without breaking the rhythm of harvesting & hand movement. Continuous means it unidirectional clockwise rotation.

SCALP TYPE SELECTION	No selection option, so poor accuracy during scoring.	<p style="text-align: center;">Soft / Medium / Hard</p> <p>Scalp type selection option is available on this device. This feature helps us to ascertain the punch type to be used to get optimum aesthetic results. One can choose if he needs Dull / Sharp punch as per scalp type.</p>
COUNTER	Not Available	<ol style="list-style-type: none"> 1. Counter Feature can be used as patients would like to know how many extractions have been achieved. 2. Helps gather higher patient confidence.

Therefore Microprocessor controlled Hair Trans Speed offers -

Range of Speed - 200 to 10,000 rpm

Range of Torque - 0.5 to 20 mNm

Modes of Operation - Auto reverse & Continuous

Hair Trans Speed

The Flagship product of Tejco for Follicular Unit Extraction (FUE) It is an advanced microprocessor controlled programmable device with digitized controls for **SPEED, TORQUE, COUNTER & SCALP TYPE.**

It is a hand-held motorized devices which allows surgeons to isolate, dissect and extract follicular units with steady speed and precision, with minimal potential for transection

Key benefits

- LCD display
- Microprocessor controlled programmable device with 9 program setting options
- Scalp type selection feature
- Speed bar graph
- Counter ranging from 1-5000
